DokuWiki customizations for FIXES

Changelog setting

Our setting for changelog under FIXES changelog looks like this:

```
<WRAP >
{{changes>count = 1000 & type = create, edit, minor & render =
list(dayheaders, signature, summary)}}
</WRAP>
```

Change height of editor window

To set a custom default height of the editor windows of DokuWiki create a file named `userscript.js` under `conf/` of the DokuWiki base directory. Then add this content:

```
jQuery(function() {
    jQuery('#wiki__text').height('600px');
});
```

> Remind to set the accurate permissions on this file so that the httpd can read it! Otherwise your custom set default height will not work!

URL-Rewriting

To make the URL look more fancy, you can use URL-rewriting. Our configuration for this wiki looks like this:

1. Edit `conf/local.php` and add the following line:

```
$conf['userewrite'] = 1;
```

`userewrite` can have this values:

Value	Description	Example URL
0	Kein URL Rewriting. Dies ist die Standardeinstellung.	http://example.com/dokuwiki/doku.php?id=wiki:syntax
1	Rewriting wird vom Webserver durchgeführt.	http://example.com/dokuwiki/wiki:syntax
2	Rewriting wird von DokuWiki durchgeführt.	http://example.com/dokuwiki/doku.php/wiki:syntax

2. Then edit your `apache2/httpd` config (`httpd.conf` or `apache2.conf`) to load the required

module:

`httpd.conf`: Add this line:

```
LoadModule rewrite_module modules/mod_rewrite.so
```

`apache2.conf`: Execute this command to enable the module:

```
a2enmod rewrite
```

3. Edit your virtual host config: Change the line beginning with `AllowOverride` to `AllowOverride All`.

4. Then copy the `.htaccess.dist` from the dokuwiki base directory to `.htaccess`. Then uncomment the following lines:

```
RewriteEngine on

RewriteRule ^_media/(.*)              lib/exe/fetch.php?media=$1  [QSA,L]
RewriteRule ^_detail/(.*)             lib/exe/detail.php?media=$1  [QSA,L]
RewriteRule ^_export/([^/]+)/(.*)     doku.php?do=export_$1&id=$2  [QSA,L]
RewriteRule ^$                        doku.php  [L]
RewriteCond %{REQUEST_FILENAME}       !-f
RewriteCond %{REQUEST_FILENAME}       !-d
RewriteRule (.*)                      doku.php?id=$1  [QSA,L]
RewriteRule ^index.php$               doku.php
```

5. Finally restart apache or httpd.

Optional So make Dokuwiki use slashes instead of colons for seperating the namespaces in the url, activate the configuration setting `useslash` in the Advanced-section of the Dokuwiki config
