

LXC correct domain for Postfix

When using postfix within a Proxmox Container (LXC), Postfix might source a wrong domain and just appends `.localdomain` to the sender/receiver address. To change that edit `/etc/postfix/main.cf` and change the line `mydomain = :`

```
mydomain = <yourdomain>
```

If not changing that, `.localdomain` would be used although the `/etc/hosts` contains the correct domain.
